## **ACKNOWLEDGEMENTS**

Authors would like to express their sincere gratitude to Secretary, DARE and Director General, ICAR, Ministry of Agriculture & Farmer`s Welfare, for his constant guidance and support in bringing out this bulletin on action plan for seromonitoring of CSF-CP under NADCP. It is to place on record our acknowledgement to Deputy Director General (Animal Science) for his valuables suggestions and moral support in bringing out this bulletin on sampling plan.

Our special thanks are due to Department of Animal Husbandry and Dairying, Ministry of Fisheries, Animal Husbandry and Dairying, Government of India, New Delhi for their encouragement in planning to bring this bulletin. Authors also acknowledge the Director (A), ICAR-NIVEDI for his support and encouragement in bringing out this book on Action plan for seromonitoring of CSF-CP under NADCP- 2022.

Authors thank all the Scientists of ICAR-NIVEDI for their inputs in bringing this book. We also thank our research fellows working in Spatial Epidemiology lab of ICAR-NIVEDI for their hard work in programming and technical assistance in generating sampling plan

## Introduction

India has 9.06 millions of pigs as per 20<sup>th</sup> Livestock Census and 47% of them are in north eastern India (DAHD, 2019). Further, in Mizoram, people are culturally and socially bound by household pig rearing. There is a reduction of 12.03% in pig population compared to 19<sup>th</sup> Livestock Census. Pigs are mostly reared by socio-economically disadvantaged people whose livelihood is affected if pigs die due to diseases and the classical swine fever is the most common disease affecting pigs in India. CSF is a highly contagious, dreadful disease affecting susceptible domestic and wild pigs causing 100% mortality in piglets and varying symptoms/signs in adult pigs depending on age, breed, and virulence of virus. With increasing age of the infected pigs the clinical signs are less specific and recovery with production of antibodies can occur. Hence, more seropositivity in adult animals. CSF is caused by CSF virus belonging to the genus *Pestivirus*, family *Flaviviridae*. CSF is endemic in India. All states of India have reported seropositivity of CSFV antibodies.

Table. 1. Region wise details of pig serum samples tested for CSF antibodies in India (Patil et al., 2021)

Region	No Tested	No Positive	Percent Positivity
North	759	241	31.75
East	522	208	39.85
North East	3607	1398	38.76
South	367	111	30.25
West	326	182	55.83
Central	267	113	42.32
<b>Total</b>	<b>5848</b>	<b>2253</b>	<b>38.52</b>

There is a dearth of availability of vaccine in India and vast majority of pigs are not vaccinated against CSF.

CSFV antibodies were detected in majority of pigs that survived the virus infection and were the potential source of virus infection to the other susceptible animals. It is explained in the context of high seropositivity in spite of not vaccinating. At the same time CSFV infection causes 100% mortality in piglets

Therefore, a continuous surveillance of CSF in pigs is the best method to be adopted to prevent the spread of disease and to formulate control strategies. Additionally, upon vaccinating the

animals, detection of vaccinal antibodies in the herd is of prime most important towards the assessment of herd immunity and subsequently leading to the eradication of disease.

ICAR-National Institute of Veterinary Epidemiology and Disease Informatics (NIVEDI) is conducting surveillance of livestock diseases regularly and advising the state animal husbandry departments as an advisory to take appropriate intervention in controlling the disease. **With this background, following objective is planned**

1. Monitoring of Classical swine fever during implementation of Control Programme (CSF-CP)

### **ACTION PLAN (SOP)**

**CSF CP: ICAR-NIVEDI is committed to work actively under the LH& DC: CSF-CP with active support from other stakeholders**

The CSF Ab Check kit developed by ICAR-NIVEDI is for detection of antibodies against CSF and is not capable of differentiating vaccinated from infected animal.

**CSF Ab Check Kit** (ICAR-NIVEDI) will be used for seromonitoring with the sampling strategies as described in the following sections

**Strategy of vaccination: Yearly**

**Questions to be answered by ICAR-NIVEDI with active support from other stakeholders during the course of the control program:**

1. What is the baseline antibody level in the population?
2. What is the Year-wise progressive response of the animal to blanket vaccination?
3. What is the progressive herd/population immunity level in time series (five years)?
4. What is the status of outbreak of the disease in the population during the control program- Spatial and temporal mapping at village-taluk/district level covering entire India to define the true hotspots?
5. What is the changing pattern in terms of course of the clinical disease and pathogenesis including strain variation, if any, during the period of control program?

6. What is the progressive status of the infection/disease in other/unusual hosts during the control program?
7. What is the progressive syndromic/clinical surveillance picture during the control program?

**Rationale for the above questions:**

1. Pre vaccination serum samples from pigs above 3 months of age (maternal antibodies will be absent) will be collected randomly at each round of vaccination in order to assess the antibody level in pigs that will be almost nil and that becomes the baseline information.
2. As the vaccination of pigs continues yearly, it is presumed that the significant rise in antibody level in each animal would be attained. Measurement of antibody as seromonitoring would throw light on how efficient was the response from pigs to each rounds of yearly vaccination.
3. After completion of each round of vaccination starting from the beginning year, protective antibody level in herd/population is expected to increase and maintained in increasing population progressively with each year of vaccination. The surveillance of the population planned would throw light on how effectively the population immunity has increased over the period of 5 years of vaccination.
4. Disease outbreak should gradually be reduced as the yearly vaccination progresses. However, some disease outbreaks may be/will be recorded at village/taluk level, which however, is supposed to gradually reduce as the yearly vaccination progresses. Recording the yearly outbreaks during the course of the control program and mapping of the regions progressively would provide clear picture of the impact of vaccination towards control of the disease and the hotspots of outbreak. Further, this will also inform the special attention in strategic interventions required for effectiveness.
5. During the course of progressive yearly vaccination, as the susceptible animal reduces in the population, there are likely chances of changes in the pathogen leading to changes in pathogenesis/pattern of disease/course of the disease. This changes in the pathogen strain variation may lead to escape from the vaccinal antibody onslaught in the host. Monitoring these changes in host response/ strain variations are of immense importance to understand the effectiveness of the vaccination and the course correction/strategic intervention required if any
6. Progressively as the vaccination programme continues covering a large population of pigs under blanket vaccination with the establishment of herd immunity, the infection/disease is likely to

spill over to wild boars wherever there is an interface existing between domestic and wild boar/pig population. Such population should be closely monitored to understand if the virus is trying to escape and hide in the unusual host due to the pressure exerted by vaccination in natural host.

7. During the control programme as the immunity level increases, the occurrence of the infection/disease is likely to be reduced due to reduced transmission rate. At the field level, veterinarians' clinical/syndromic observation with systematic recording would inform the changing pattern over time during the course of the control program.
8. Herd/population immunity is expected to be more than 80% at the end of five years' of vaccination/control programme. Continuous monitoring over the control program would inform the actual status of population immunity attained at the end of the period.

### **Technical Guidelines**

#### **The Work Plan (Year wise) for ICAR-NIVEDI for the success of CSF-CP:**

##### **Seromonitoring and surveillance:**

##### **Strategy of Vaccination: Yearly**

##### **I. Seromonitoring**

##### **(1)-1<sup>st</sup> Year**

**Vaccination:** The pigs of 3 months and above will be vaccinated.

- (i) **Baseline survey:** The serum is collected at zero day before vaccination. Target population is of the age 3-12 months. **(Sampling Plan).**
- (ii) For seromonitoring, serum is collected between 30-50 days post vaccination. Target population is of the age 4-12 months. (Sampling Plan).

##### **(2)-2<sup>nd</sup> Year:**

-Pre-vaccination status: Serum (Sampling Plan) will be collected before 2<sup>nd</sup> round of vaccination targeting animals of 3-15 months of age for detection of antibodies against CSFV which would reflect the level of infection/exposure to the virus in the susceptible young population in the field.

**-Vaccination:** The pigs of 3 months and above will be vaccinated.

**-Post vaccination monitoring:**

-Seromonitoring: For seromonitoring, serum is collected between 30-50 days post vaccination (Sampling Plan).

- Population immunity will be checked in the age group of above 9 months of pigs after 6 months post vaccination

**(3)-3<sup>rd</sup> Year:**

-Pre-vaccination status: Serum (Sampling Plan) will be collected before 3<sup>rd</sup> round of vaccination targeting animals of 3-15 months of age for detection of antibodies against CSFV which would reflect the level of infection/exposure to the virus in the susceptible young population in the field.

**-Vaccination:** The pigs of 3 months and above will be vaccinated.

**-Post vaccination monitoring:**

-Seromonitoring: For seromonitoring, serum (Sampling Plan) is between 30-50 days post vaccination. Target animals of age between 4 – 12 months (primo vaccinate).

-Population immunity will be checked in the age group of above 9 months of pigs after 6 months post vaccination.

**(4)-4<sup>th</sup> Year:**

-Pre-vaccination status: Serum (Sampling Plan) will be collected before 4<sup>th</sup> round of vaccination targeting animals of 3-15 months of age for detection of antibodies against CSFV which would reflect the level of infection/exposure to the virus in the susceptible young population in the field.

**-Vaccination:** The pigs of 3 months and above will be vaccinated.

**-Post vaccination monitoring:**

-Seromonitoring: For seromonitoring, serum (Sampling Plan) is collected between 30-50 days' post vaccination from animals of age 4 – 12 months (primo vaccinate).

-Population immunity will be checked in the age group of above 9 months of pigs after 6 months' post vaccination.

### **(5)-5<sup>th</sup> Year:**

Pre-vaccination status: Serum (Sampling Plan) will be collected before 5<sup>th</sup> round of vaccination targeting animals of 3-15 months of age for detection of antibodies against CSFV which would reflect the level of infection/exposure to the virus in the susceptible young population in the field.

**-Vaccination:** The pigs of 3 months and above will be vaccinated.

### **-Post vaccination monitoring:**

-Seromonitoring: For seromonitoring, serum (Sampling Plan) is collected between 30-50 days post vaccination from animals of age 4 – 12 months (primo vaccinate).

-Population immunity will be checked in the age group of above 9 months of pigs after 6 months post vaccination.

## **II. Surveillance of CSF**

Surveillance of CSF is a continuous activity conducted throughout the control programme and following are the main components of surveillance activities

**(1) -Outbreak Investigation:** all the outbreaks post launching vaccination under control program will be systematically investigated for course of the disease and its changing pattern including strain variations, if any, and mapping. (in close collaboration with State Animal Husbandry Departments)

**(2)-Surveillance in other/unusual hosts:** Wild boar and other unusual host – important in re-emergence of CSF in domestic pigs. (in collaboration with Wildlife Institute of India and State Forest Departments)

**(3)-Syndromic surveillances:** During the course of the control program a questionnaire based syndromic surveillance protocol will be developed by ICAR-NIVEDI and used by the field veterinarians. (in close cooperation with State Animal Husbandry Departments)

**(4)-Final Surveillance:** at the end of 5<sup>th</sup> year: to assess the population immunity level as a consequence of CSF-CP for five years.

Overall assessment of progress will be recorded by analyzing the seromonitoring and surveillance data, OB records, strain record, the population immunity level and status of the disease in other hosts in time series manner. Based on the assessment, futuristic strategic planning for next phase

of control programme will be drawn and communicated for policy decisions.

Appropriate Sampling plans (1-15) will be provided during the time course.

### **Limitations of Vaccination Programme**

In general, fattening pigs are slaughtered at the age of 9-12 months (100-125 kg body weight). Considering this farming practice, piglets of less than 3 months of age will be more than 13 months during the annual vaccination programme. Such animals may not be covered under vaccination plan as they are slaughtered by 12 months of age. Therefore, six monthly vaccination plan would cover such piglets.

### **III. Other activities:**

**(1)-Data management:** Cumulative data management protocol will be developed at ICAR-NIVEDI and ID/password based data entry access will be provided to the centers. The data will be validated by the sample test results at ICAR-NIVEDI before final entry to master data base server at ICAR-NIVEDI. The data related to other activities as delineated would also be entered and analysed (A detailed information is given in **Annexure I**)

#### **(2)-Sampling Strategy**

#### **Population adjusted Two -stage sampling plan for Seromonitoring of Classical Swine fever (CSF) under CSF-CP**

Disease Monitoring refers to a continuous, dynamic process of collecting data about livestock health (pig) and disease events and their determinants in a given animal population over a defined time period. Infectious disease monitoring in general and Classical swine fever (CSF) in particular has become increasingly important for Veterinarians, researchers and academicians. Disease monitoring in pig population describes the ongoing efforts directed at assessing the pig population health and disease status of a given population and routine collection of information on disease, productivity and other characteristics possibly related to them in a population. Probability sampling is appropriate for achieving the disease monitoring objectives are unfamiliar among disease managers and research scientists because training for most of them is based on classical experimental design in which control, manipulation and replication are cornerstone.

Monitoring and evaluation framework shows the how animal health inputs and processes (livestock health workforce and infrastructure) are reflected in outputs (eg. Interventions and available services) that in turn are reflected in outcomes (eg. Coverage) and impact (morbidity and mortality). The added value of framework is that it brings together indicators and sources across the result chain in its entity i.e from Inputs/process, Outputs, outcomes to impacts. It is designed to address monitoring and evaluation needs for different users and multiple purposes, including

- 1) Monitoring of program inputs, process and results, required for the management of pig population health system investments
- 2) Health system performance assessment as the key-for country decision-making processes
- 3) Evaluating the results of health reform investments and identify which approaches works best.

Sample surveys mostly rely on probability sampling to choose sample units e.g. Small areas or individuals, for observation from population of interest. Probability sampling is most often used when the objective is to estimation of population protection levels, prevalence etc., In probability sampling, well defined rule or algorithm is invoked to randomly select a sample of units for observation from the list of all possible sample units (Sampling frame) that conceptually represent the population of Interest. The selection algorithms/rule and sampling frame allow us to calculate the probability that a sampling unit is included in the sample and derive the estimators for a specific sample design. Because of the selection probabilities are known, valid statistical properties of estimators can be derived, which provide the basis for evaluating the scientific credibility of the estimates. Estimation of frequency of disease/basic reproduction number/protection levels is a prerequisite to establish the disease control program, hence sampling the populations in order to estimate the disease frequency/Basic reproduction number is common task for epidemiologists. In sampling, we ensure that animals are typical of the target population that the estimate of disease frequency/basic reproduction number is unbiased and precise (low standard error). Simple random sampling, systematic or stratified random samplings are the most commonly used sampling methods in which the animal is sampling unit, provides the precise estimates of disease frequency.

Two -stage sampling plan is a form of epidemiological investigations requires the scientific sampling for collection of data on health problems includes serum samples in surveillance/monitoring in a specific population. In this sampling plan, the first sampling stage involves the selection of predetermined number of clusters (Districts, Blocks or villages), the clusters are mutually exclusive sub-population, most often constructed from recognized

administrative boundaries with the probability proportional population size. In the second stage, animals are selected from each cluster in the field based on random walk method, which identify the center of the cluster or another easily distinguishable feature such as main street, and selecting a random direction to walk, thus drawing the sample transect across the cluster. The use of two-stage sampling has evolved to meet monitoring objectives for two reasons. First, list of frames of animals for randomized sample selection do not typically exist at a regional or national level, but the list frames of herds or villages can be developed and maintained more readily.

### **The objectives of the sampling plan of Seromonitoring of CSF in India**

1. To provide the Sampling Scheme for estimation of total number of pigs to be sampled, total number of villages (farms) to be selected, number of animals within the village/Farms to be sampled and location of villages for seromonitoring of CSF in India.

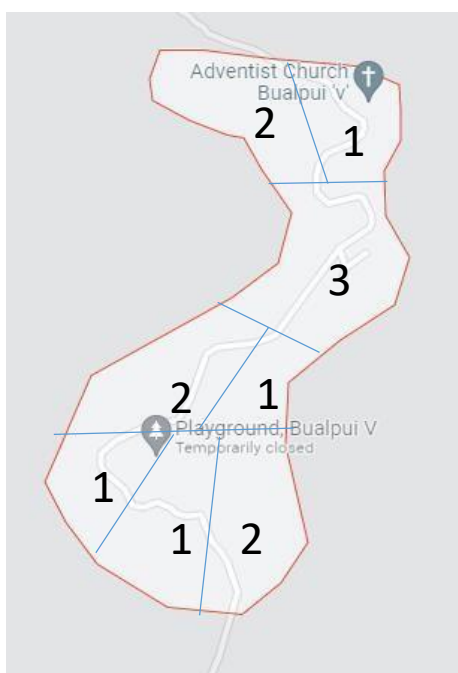

The input requirements of sampling plan were (1). 100- % of protection level has been used with conservative estimate of minimum 80% protections in the pig population after the intervention (2) cluster or village level protection level is adjusted to the size of population varying from 10% to 30% (3) sensitivity of 90% and specificity of 90% of diagnostic tests and 4. 95% for Confidence Interval /system confidence. Two -stage stratified random sampling plan was generated using in-house developed epi-calculator ([https://nivedi.res.in/Nadres\\_v2/Epical/stratified/random\\_sampling.php](https://nivedi.res.in/Nadres_v2/Epical/stratified/random_sampling.php)). Whereas state and districts within each state were chosen based on population based criteria (Probability proportional to population size), blocks were randomly selected associated with number of farms/villages and samples per farm. The sampling plan will provide the guidelines for selecting villages/farms within village and its location like block, district and state level information along with livestock population, number of birds to be sampled within village/Farms and proportion of pigs to be sampled in each selected village. The summary of sampling plan generated using two-stage stratified random sampling scheme is presented in Table 1.

Table 1: Sampling plan for seromonitoring of CSF in India

SI No	STATE	NO OF DISTRICTS	NO OF BLOCKS	Total no of Pigs	No of Animals to be Sampled	Average No of Samples Per Districts

### Sampling at village level:

In a given village under block and district, hypothetically divide the entire village into 8 sections and pick the requisite number of samples from the households from each section randomly. In a Village named Bualpui NG (Block: Sangau; District: Lawngtla) in Mizoram, a total of 13 pig serum samples to be collected as shown below.

In a situation where, the distribution of pig holdings is limited, then follow the snowball technique wherein the first household/pig holdings/pig farm is visited for sampling. Subsequently visit of the next pig holding is planning based on the information provided by the previous owner.

**CSF-CP/SERMON/SAMPLING PLAN/NIVEDI/Andaman And Nicobar Islands\_1/Phase I****Stratified Random Sampling:**

Species Selected for Stratification = Pigs

Justification: Deep freezers: -80°C are required to store the serum samples received from different states till results are finalised and analysed.

Deep freezers: -20°C are required to keep the reagents and aliquots of antigens required for kit preparation.

Refrigerators are required to the chemicals and media required for production of recombinant cultures containing clones of antigen.

Racks and Cryoboxes: Required for preservation of serum vials in boxes in racks stacked

High end computer: Required for initial data entry and storage of all information related to the samples submitted to laboratory which required huge memory.

Manpower

JRF/SRF: Required for production of recombinant antigen in bulk by culturing the bacterial culture, harvesting, purification, and quality testing of each batch of antigen produced.

YP II: Receipt of samples, storing of samples, production of kits and performing ELISA, interpretation and entry of results into database into the computer

Lab supporting staff: For routine works like arrangements for autoclave, disposal of bio-waste materials, filing of information received from state units etc.

Contingency: For routine expenses like papers, printing cartridges, stationeries etc.

High Configured work station with complete accessories: Required for big data analytics, storage, retrieval and spatial/GIS analyses. Development of software applications, mobile apps, for real time datacapture and analyses.

High end Desktops: Required for multimodal nodal data entry and storage, for analyses and presentation.

Laptops: Required for testing of software applications and mobile apps developed for real time capture of data and analyses.

Manpower

YP II: Required for data capturing, data entry, storage building, cleaning of data and analyses.TA;

Required travelling to different centres for testing the application

Consumable: For purchase petty IT items required on day today basis.

Contingency: For purchase of cartridges, stationaries etc.

Details of training programme

	Year 1	Year 2	Year 3	Year 4	Year 5
Skill development training online and Offline Data entry and analyses	Sensitization of Vety Officers about data entry in the designed format and its submission to the central unit at NIVEDI for 1 day in batches.	Training of Vety Officers about analyses of results/data generated from testing of sera samples and interpretation	Training of Vety Officers about analyses of results/data generated from testing of sera samples and interpretation	Training of Vety Officers about analyses of results/data generated from testing of sera samples and interpretation	Analyses of results of respective states and final compilation

**Principal Investigator:**

Dr. S. S. Patil, Principal Scientist, ICAR-NIVEDI, Bengaluru

**Co-Principal Investigators:**

Dr. K.P. Suresh, Principal Scientist, ICAR-NIVEDI, Bengaluru

Dr. Jagadish Hiremath, Senior Scientist, ICAR-NIVEDI, Bengaluru

Dr. Shivasharanappa Nayakawadi, Sr.Scientist, ICAR-NIVEDI, Bengaluru

Dr. R. Sridevi, Senior Scientist, ICAR-NIVEDI, Bengaluru

Dr. G. Narayanan, Scientist, ICAR-NIVEDI, Bengaluru

Dr. H.B. Chethan Kumar, Scientist, ICAR-NIVEDI, Bengaluru

Forwarded with Comments by the competent authority

For successful implementation of CSF-EP program initiated by DHD Govt of India, the action plan proposed by a highly Capable Scientists team for ICAR-NIVEDI is not only highly appropriate but also include well planned activities related to monitoring & surveillance of CSF as the input of mass vaccination under control program. The action plan needs to be supported.
