## **Foreword**

Foot and Mouth Disease (FMD) is a widespread animal disease that affects cloven-hoofed farm animals and a variety of wild animals. High fever, salivation, vesicle formation in the mouth and foot, and lameness are all symptoms of FMD. Although the disease does not normally cause substantial mortality in adult animals, it does have devastating effects on them, such as weight loss, decreased milk output, and loss of draught power, resulting in a significant loss of productivity for a period of time. In India, three serotypes (O, A, and Asia1) are now common.

Livestock is a significant sub-sector of Indian agriculture that offers numerous options for self-employment. In India, the yearly direct loss due to FMD is estimated to be Rs. 20,000 crore (about 3.5 billion USD), with indirect losses due to trade barriers potentially considerably higher. Given the severity of the disease, India's FMD Control Program (FMD-CP) was initiated in 2003-04 in 54 districts across eight states, involving 30 million cattle and buffaloes, with the goal of creating FMD-free zones and subsequently expanding these zones to cover the entire country (as per Progressive Control Pathway of FAO). Under the scheme, all cattle and buffaloes must be vaccinated against FMD on a six-monthly basis with an inactivated trivalent FMD vaccine.

In September 2019, the Hon'ble Prime Minister launched the Livestock Health Disease Control Programme (LHDCP), a flagship scheme to control FMD and Brucellosis by vaccinating 100% of cattle, buffalo, sheep, goat, and pig populations for FMD and 100% of bovine female calves 4-8 months of age for brucellosis. The LHDCP's main goal is to control FMD via immunisation by 2025 and eradicate it by 2030. This will lead to higher domestic output and, as a result, increased milk and livestock exports. LHDCP for FMD and Brucellosis is a Central Sector Scheme in which the Central Government will provide 100% of money to the States / UTs.

The use of post-vaccination Seromonitoring (PVM) to track the progress of the FMD control programme is critical. To conduct PVM, the serum samples collected before and 21 to 30 days after vaccination will be tested to measure protective antibody response. Given the country's vast livestock resources, a two-stage sampling approach is critical for the systematic collection of representative samples and subsequent laboratory testing. The sampling plan outlined in this bulletin serves as a reference for collecting samples from around the country for testing for FMD vaccine-induced antibody responses under the LHDCP. I would like to express my gratitude to the Directors, Scientists of ICAR-NIVEDI, and ICAR-NIFMD for taking the effort to develop this important bulletin for use in the country's FMDCP.

## **ACKNOWLEDGEMENTS**

It is our immense pleasure to express the sincere gratitude to Secretary, DARE and Director General, ICAR, Ministry of Agriculture & Farmer's Welfare, for his constant guidance and support in bringing out this booklet on the sampling plan for V round of Seromonitoring of FMD under Livestock Health and Disease Control Programme (LHDCP)

It is to place on record our acknowledgement to Deputy Director General (Animal Science) for his valuable suggestions and moral support in bringing out this booklet.

Our special thanks are due to Department of Animal Husbandry & Dairying, Ministry of Fisheries, Animal Husbandry and Dairying, Government of India, New Delhi for encouragement in planning to bring this booklet.

We are thankful to Director, ICAR-National Institute of Veterinary Epidemiology & Disease Informatics, Yelahanka, Bengaluru

Authors thank all the Scientists of ICAR-NIVEDI and ICAR-NIFMD for their inputs in bringing this booklet.

We also thank our research fellows working in Spatial Epidemiology Lab of ICAR-NIVEDI for their hard work in programming and technical assistance in generating sampling plan

# **Sampling Plan for Sero-monitoring of FMD in India under Livestock Health and Disease Control Programme Round- V**

## **Introduction**

Foot and mouth disease (FMD) is a highly contagious viral infection that can have serious socioeconomic consequences wherever it is found. FMD is a significant livestock disease in India, with three of the seven FMD virus serotypes (O, A, and Asia 1) being prevalent. The most important requirements in the fight against FMD are vaccination, along with zoo-sanitary measures and restrictions on animal mobility. Since 2004, the government-sponsored vaccination-based FMD control Programme beginning with 54 districts in 2004 has gradually expanded to cover the entire country in 2018-19.

Post-vaccination monitoring (PVM) is required for countries pursuing a vaccine-based FMD control policy to assess the effectiveness of vaccination regimens and programmes. It is also an important component of the FMD surveillance programme. Furthermore, countries seeking official certification by the World Organization for Animal Health (WOAH) of supported national control programmes or national or zonal FMD vaccination freedom must conduct post-vaccination sero-monitoring (PCP-FMD stages 3 and beyond). Because a variety of factors can influence the efficacy of FMD vaccination, the programmes must be carefully monitored to identify flaws and ensure long-term disease control. Demonstrating the influence of vaccination programmes on disease burden helps to justify vaccination costs while identifying flaws in the immunization programme that allow for programme changes. The heart of PVM is estimating the immunity of the population targeted for vaccination protection, as this is a significant indicator of how well vaccination was carried out and whether or not infection protection is likely. Protective antibody responses elicited by vaccination can be measured by serological tests that detect antibodies directed against viral structural proteins (SP tests). (Foot and Mouth Disease Vaccination and post-vaccination monitoring guidelines, Editor Samia Metwally & Susanne Munstermann, Published by FAO and OIE, 2016)

## **Sero-monitoring under LHDCP**

Livestock Health and Disease Control Programme (LHDCP), launched by GoI aims to control livestock diseases, FMD and Brucellosis by 2025 and eradicate these by 2030. The entire cost of the scheme is to be borne out by the Central Government. Under LHDCP, bi-annual vaccinations, of all eligible cattle and buffaloes with a trivalent vaccine containing serotypes O, A, and Asia1 are practiced for protection against FMD. ICAR-NIFMD and its 32 state FMD regional and collaborating centers are assigned with the estimation of the level of serotype-specific antibodies to the structural proteins of FMDV in the serum samples collected at 0 days and 21 to 30 days' post-vaccination by the respective state AH departments. Various serological tests such as Solid Phase Competition Enzyme-Linked Immunosorbent Assay (SPCE), Liquid-Phase Blocking ELISA (LPBE), and the Virus Neutralization Test (VNT) have been recommended by the WOAH for SP antibody screening. Among these, VNT is time-consuming and labour-intensive and for this reason, ELISAs are the preferred tests in many countries. In India, Solid Phase Competitive ELISA (SPCE) in four dilution format developed by NIFMD has been adopted and approved by DAHD for the Seromonitoring activity under FMDCP. The SPCE is suitable for mass serology and is routinely used in World Reference Laboratory (WRL) on FMD, Pirbright, UK. Further, the specificity of the SPCE was reported by many research publications to be considerably higher than that of the LPBE and almost equivalent to that of the virus neutralization test. It is easier to use, more robust, and specific, and therefore offers an improvement for FMD virus-specific antibody detection.

## **SPCE Interpretation**

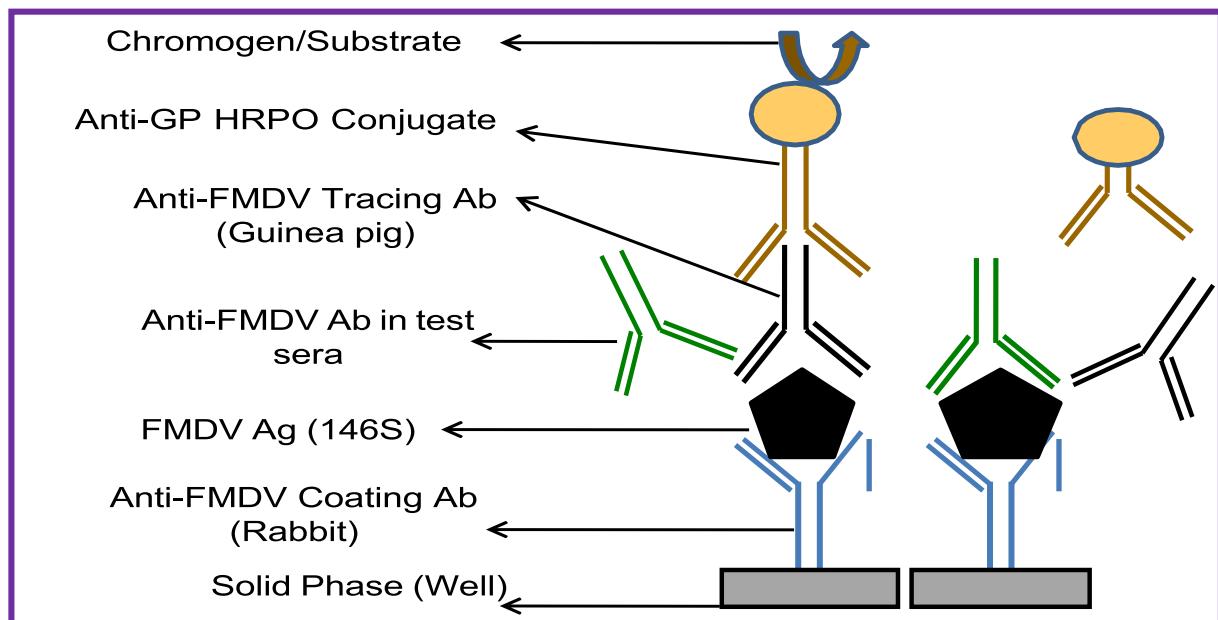

### **Principle**

In this assay, to the FMDV-antigen captured plate (*Solid phase*), serial two-fold dilutions of test sera and optimal concentration of homologous serum (raised in guinea pig) are added simultaneously. The FMDV-antigen is blocked by the antibodies (*against the structural protein of FMDV*), if present, in the test serum and restricts the binding of homologous guinea pig serum. Subsequently, the antibody inhibition is traced by adding pre-titrated anti-guinea pig-HRPO conjugate and substrate reaction is followed as in the case of a standard ELISA (Fig 3). The colour reaction is stopped and measured in terms of optical density (OD) at 492 nm wavelength with reference to 620 nm. Six wells were used as antigen controls (0% inhibition; C0) and two wells were used as conjugate control (Cc) without any antigen to determine the background reactivity.

The OD<sub>492</sub> values of the test samples are expressed as a percentage of inhibition relative to the OD<sub>492</sub> value of antigen controls (C<sub>0</sub>). The titer of serum samples is expressed as the reciprocal of the serum dilution giving 65% Optical Density (OD) as compared to the antigen controls. In other words, the reciprocal of the serum dilution inhibits 35% (Percent Inhibition) of the binding of anti-FMDV guinea-pig serum to the homologous virus. The formula is given below.

**Percentage of Inhibition (PI) =**

$$100 - \left\{ \frac{\text{Mean OD of sample}-\text{Mean OD of } C_c}{\text{Mean OD of } C_0 - \text{Mean OD of } C_c} \times 100 \right\}$$

**Fig 1. Schematic representation of Solid Phase Competitive ELISA for detection of anti-FMDV antibodies against the structural protein**

### Validation Criteria

The test is considered valid, if the median O.D. <sub>492</sub> of antigen control wells (C<sub>0</sub>) >0.8 and The mean O.D.<sub>492</sub> of conjugate control wells (Cc) is not more than >0.1.

### **The threshold for interpretation of protective antibody level**

- Protective antibody level is expressed as  $\log_{10}$  titer and antibody titer of  $\geq 1.65$  is considered as the protective level.
- Note: Please use the software provided by ICAR-NIFMD for the calculation of protective titre

### **The Sampling Strategy followed for PVM**

In India, districts are divided into talukas or blocks, which are then subdivided into villages. Villages are regarded as a single epidemiological entity (epi-unit). Until 2019, a two-stage stratified random sampling approach was used for PVM investigations. In the first stage, a randomization calculator was used to select 10 villages in each district, ensuring that each taluka was represented for sampling. In the second stage, a simple random sample procedure was used to pick 20 bovines (over 24 months of age) from each village for sampling (before and after the vaccine). Using a randomized calculator, the entire sample collection process (pre-vaccination and post-vaccine sampling) was repeated during each round of vaccination. It is crucial to note, however, that the villages in each district were rotated to collect pre- and post-vaccination serum samples throughout each round of vaccination.

The above post-vaccination sampling approach was created to determine the vaccine's and immunization program's efficacy. However, specialists from the WOAH FMD Mission in India believe that, in order to present a clear picture of population immunity, the sampling approach should be changed in accordance with WOAH guidelines. In response to the advice, ICAR-NIVEDI has been developing a new post-vaccination sero-monitoring sampling technique in conjunction with ICAR-NIFMD since 2020. The current document is for LHDPC round 5 samplings.

### **Salient points considered while formulating sero-monitoring documents**

While formulating the sampling plan for the sero-monitoring following recommendations provided in the WOAH & FAO FMD vaccination and sero-monitoring guidelines were adopted. Therefore, sampling at two different points in time (0 days, ie., at the time of vaccination) and again after 21days post-vaccination to assess the changes in population immunity at the animal level (for PCP stages 2 & 3), at different age groups. Below each state-wise sampling plan table, the number of samples to be drawn from different groups per village (Epi Unit) is given and it is suggested that the state animal husbandry departments should strictly adhere to the sampling SOP provided.

## **Two-stage Stratified Random Sampling plan for PVM**

All form of epidemiological investigations requires a scientific sampling plan for the collection of data on health problems including serum samples in surveillance or monitoring in a specific population. Estimation of the frequency of disease is a prerequisite to establishing the disease control program, hence sampling the populations in order to estimate the disease frequency is a common task for epidemiologists. In sampling, we ensure that animals are typical of the target population and that the estimate of disease frequency is unbiased and precise (low standard error). Simple random sampling and systematic or stratified random samplings are the most commonly used sampling methods in which an animal is a sampling unit, providing precise estimates of disease frequency.

The use of two-stage sampling has evolved to meet surveillance or monitoring objectives for two reasons. First, the list of frames of animals for randomized sample selection does not typically exist at a regional or national level, but list frames of herds or villages can be developed and maintained more readily.

The objectives of sero-monitoring of FMD in India

1. To provide the Sampling Scheme for estimation of the total number of animals to be sampled, the total number of villages (epi units) to be selected, the number of animals within the village to be sampled, and the location of villages for pre-seromonitoring of FMD in India.
2. To use the same sampling scheme for post-vaccination monitoring to estimate the unbiased and robust estimate of protection levels of FMD in India.

In this scheme, we employed stratified random sampling with the district as a stratification variable for buffalo and cattle populations in different states. The input requirements of the sampling plan were (1). animal level prevalence of non-protection ( $1-P(\text{protection})$ ) is 20% is used as the median value of non-protection levels across the different age groups of animals, (2) cluster or village level prevalence to adjust for the state level population, so that herd level prevalence is proportion to the proportion of the population, and capturing the variation arising out of this, adjusted against the percentage of animals showing protective titer against FMD virus serotypes O, A and Asia1 in different States/UTs and (3) sensitivity of 90% and specificity of 90-100% of diagnostic tests and confidence is assumed for all the States/UTs at 90%. (4) Accounting for a state-wise percentage of protective levels of monitoring status of previous rounds. Two-stage stratified random sampling plan was generated at 95% confidence using an in-house developed epi-calculator ([https://nivedi.res.in/Nadres\\_v2/Epical/stratified/random\\_sampling.php](https://nivedi.res.in/Nadres_v2/Epical/stratified/random_sampling.php)). The Sampling plan will

provide the guidelines for selecting villages and its location like block, district, and state level information along with livestock population, number of animals to be sampled within a village, and proportion of buffaloes and cattle to be sampled in each selected village. The summary of the sampling plan generated using two-stage stratified random sampling scheme during the last two rounds is presented in Table1.

### **Guidelines for collection of samples within the village**

Given below is the example provided by us to the coordinating unit for sample collection.

Example: If you are asked to collect 5 samples from a village having 17 animals (cattle & buffaloes together), you are supposed to do sampling as follows;

In a table, enumerate and list all the households/owners having the given species of animals. Say for example there are three owners viz., Avinash Alur, Avinash B, Avinash Sunkad in the village with 7 (5 buffaloes & 2 cattle), 6 (3 buffaloes & 3 cattle), 4 (cattle) number of animals respectively, then make the sampling frame as follows;

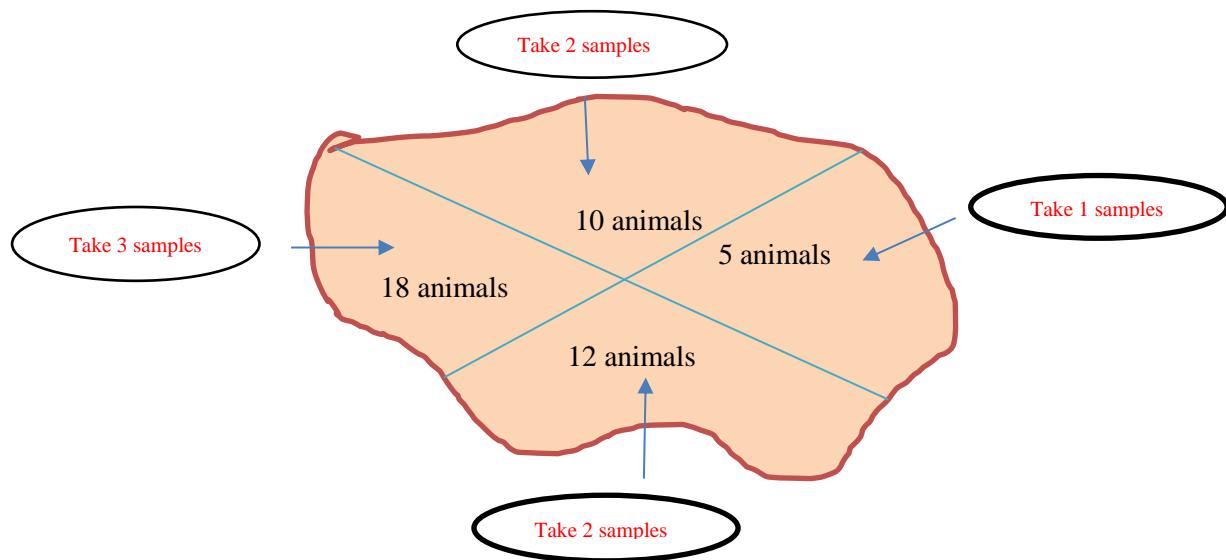

Sl. No.	Owner (Household)	Total (Cattle+Buffaloes)	Temporary ID	
1	Avinash Alur	7	AA1	
2			AA2	4 <sup>th</sup> sample
3			AA3	
4			AA4	
5			AA5	5 <sup>th</sup> sample
6			AA6	
7			AA7	
8	Avinash B.	6	AB1	
9			AB2	
10			AB3	1 <sup>st</sup> sample
11			AB4	
12			AB5	
13			AB6	2 <sup>nd</sup> sample
14	Avinash Sunkad	4	AS1	
15			AS2	
16			AS3	3 <sup>rd</sup> sample
17			AS4	

Pick a random number between 1-17 (as the village has total 17 animals)

Say, you picked 10 (S. No. 10), then identify the household/owner the pointing to the said serial number. In this case, it is house of Avinash B. Since you have to collect 5 samples from the list of 17 animals ( $17/5=3.4$ , round that to 3), mark every third animal in the list as shown above. Once you have identified the owners and the animals, go to the identified owners house, stand at the entrance/entry point of pen (shed), number the animals serially in a clockwise manner (remember

line also makes part of the circle) starting from the one nearest to the entrance/entry point. In this case, it is third nearest animal from the entrance of the pen of Mr. Avinash B. Similarly, collect all the required samples as shown in the table. You should visit all the identified houses to collect samples.

**Alternatively**, you can hypothetically divide the village in to four quarters and pick the requisite number of samples from households as shown below

**Table 1: Summary of Sampling Plan using two-stage stratified random sampling technique for Sero-monitoring of FMD in India.**

**Note:** The proportion of samples collected from each village need to be distributed among three age categories viz; 6-12 months, 13-24 months and >24months at a ratio of 5:4:1s

## **Collection and transport of serum samples**

### **Materials required**

- Vacutainers 5 ml capacity (Red Top, BD catalog No. 366430)
- Desktop Centrifuge (refrigerated preferably) with swinging bucket rotor
- Sterile 15ml polypropylene centrifuge tubes
- Sterile Cryovials (preferably internally threaded)
- 2ml, 5ml pipettes or 1ml micropipette and 1 ml sterile pipette tips.
- Ice Buckets
- Laminar Flow cabinet

### **Procedure**

- Serum should be collected using a sterile needle and syringe
- At least 2 ml of serum should be submitted to the testing laboratory and for that 4-8 ml whole blood needs to be collected without anticoagulant.
- The blood is usually collected from the jugular vein
- After collection, the sample should be allowed to stand in a cool area, out of direct sunlight for at least 15 minutes to allow clot formation
- Serum should be separated before submission to the laboratory.
- The sample should be centrifuged or, if this is not available, stand the sample in an upright position overnight in a cool box or refrigerator
- Place serum into a plain, sterile tube and send to the laboratory under cool condition
- If dispatch to a laboratory is delayed, serum samples should be frozen and stored at -20 °C
- Samples should be accompanied by a proper epidemiological datasheet

### **Serum Shipping Instructions**

- Use at least a 1-inch thick walled thermocol box for shipping of serum
- The serum samples should be preferably shipped in dry ice, if not add a sufficient number of ice packs that were earlier at stored -80°C. If ice packs are used for shipping, ensure that samples are placed within a layer of ice packs.
- Kindly ensure that there is no leakage during shipment. To do this it is wise to keep the vials in a cryo box and ship them.
- Ship the serum as quickly as possible preferably by overnight courier.
- Inform NIFMD/relevant laboratory telephonically about the shipping.

Ensure that the samples are accompanied by standard proforma in **excel** as provided below (the standard proforma is available with state FMD laboratories and also may be obtained from ICAR-NIFMD)

\*Reserved villages to be used for sampling if any selected village in given district is not accessible, having logistic problem or any other issues

a: District Name  
 b: Block Name  
 c: Village Name  
 d: Buffalo Population  
 e: Cattle Population

f: Buffalo + Cattle Population  
 g: Number of units to sample  
 h: Buffalo Proportion  
 i: Cattle Proportion

Unreserved Villages 165  
 Reserved Villages 11  
 Total Samples

2145  
 143  
 2288

Two Stage Stratified Random Sampling:

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 100+ (Cattle + Buffalo) = 6700

Design Level Prevalence (% of unprotected) = 0.2

Cluster Level Prevalence (Adjusted for % of tier improvement)= 0.04

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 82(+9 Villages Reserved)

Total No of Animals to be Sampled = 1066

DISTRICT_NAME (a)	BLOCK_NAME (b)	VILLAGE_NAME (c)	Buffalo Population (d)	Cattle Population (e)	Buffalo + Cattle Population (f)	Number of units to sample (g)	Buffalo Proportion (h)	Cattle Proportion (i)

\*Reserved villages to be used for sampling if any selected village in given district is not accessible, having logistic problem or any other issues

a: District Name  
 b: Block Name  
 c: Village Name  
 d: Buffalo Population  
 e: Cattle Population

f: Buffalo + Cattle Population  
 g: Number of units to sample  
 h: Buffalo Proportion  
 i: Cattle Proportion

Unreserved Villages 82  
 Reserved Villages 3  
 Total Samples

1066  
 39  
 1105

**Two Stage Stratified Random Sampling:**

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 100 + (Cattle + Buffalo) = 55358

Design level Prevalence (% of unprotected) = 0.2

Cluster Level Prevalence (Adjusted for % of tier improvement) = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165(+14 Villages Reserved)

Total No of Animals to be Sampled = 2145

DISTRICT_NAME (a)	BLOCK_NAME (b)	VILLAGE_NAME (c)	Buffalo Population (d)	Cattle Population (e)	Buffalo + Cattle Population (f)	Number of units to sample (g)	Buffalo Proportion (h)	Cattle Proportion (i)
