ACKNOWLEDGEMENTS

It is our immense pleasure to express the sincere gratitude to Secretary, DARE and Director General, ICAR, Ministry of Agriculture & Farmer's Welfare, for his constant guidance and support in bringing out this bulletin on sampling plan for 2nd round of seromonitoring of FMD under National Animal Disease Control Programme (NADCP)

It is to place on record our acknowledgement to Deputy Director General (Animal Science) for his valuable suggestions and moral support in bringing out this bulletin.

Our special thanks are due to Department of Animal Husbandry & Dairying, Ministry of Fisheries, Animal Husbandry and Dairying, Government of India, New Delhi for their encouragement in planning to bring this bulletin.

We are thankful Director(A), ICAR-National Institute of Veterinary Epidemiology & Disease informatics, Yelahanka, Bengaluru

Authors thank all the Scientists of ICAR-NIVEDI and ICAR-DFMD for their inputs in bringing this bulletin.

We also thank our research fellows working in Spatial Epidemiology lab of ICAR-NIVEDI for their hard work in programming and technical assistance in generating sampling plan

Foot-and-Mouth Disease: pre and post vaccination seromonitoring under National Animal Disease Control Programme (NADCP)-2nd round-2021

INTRODUCTION

Foot and mouth disease (FMD) is one of the most contagious viral diseases known, with devastating socio-economic impacts. Vaccination is one of the most important tools to combat FMD. Since many factors can influence the effectiveness of vaccination against FMD, the programmes must be monitored continuously to identify any failings and to ensure sustained control of the disease.

Demonstrating the impact of vaccination programmes on the disease burden helps to justify the vaccination cost, while identification of weaknesses in the vaccination programme enables improvements to be put in place. Very large sums of public and private money can be wasted on ineffective vaccination programmes, and farmers and other livestock stakeholders can become very discouraged about the prospects for FMD control.

Monitoring of vaccination programmes and of population immunity are important components of the surveillance system for countries embarking on vaccine-based FMD control (progressive control pathway for FMD [PCP-FMD] stages 2–3). They are also a requirement for those seeking official recognition by the World Organisation for Animal Health (OIE) of endorsed national control programmes or national or zonal freedom from FMD with vaccination (PCP-FMD stages 3 and beyond).

Estimating the immunity of the population targeted for protection by vaccination is the core of Post Vaccination Monitoring (PVM), as it is a key indicator of how well vaccination has been carried out and whether or not protection against infection is likely. Serological tests that detect antibodies directed towards the virus structural proteins (SP tests) are suited to measuring protective antibody responses induced by vaccination. (Foot and Mouth Disease Vaccination and post vaccination monitoring guidelines, Editor Samia Metwally & Susanne Münstermann, Published by FAO and OIE, 2016)

Seromonitoring of FMD Control Programme (FMDCP)

A bi-annual vaccination based FMD Control Programme (FMDCP) was initiated by the Government of India in 2004, initially covering 54 districts (Phase I) of the country. This

involves 6 monthly FMD vaccinations, with a trivalent FMDV serotypes O, A and Asia1 vaccine, of all cattle and buffaloes for protection against FMD. Serum samples before vaccination and 21 to 30 days post vaccination are collected by the respective state AH departments and tested by ICAR-DFMD for estimation of level of serotype specific antibodies. Due to initial success data generated by this institute, the programme was expanded in a phase wise manner. Currently, this programme covers the entire country. National Animal Disease Control Programme (NADCP), a 5-year project has been launched by GoI. The programme aims to control livestock diseases, FMD and Brucellosis by 2025 and eradicate these by 2030. The entire cost of the scheme is to be borne out by the Central Government

The Liquid Phase Blocking ELISA (LPBE) for monitoring of herd immunity following each round of vaccination was used till the year 2015. Subsequently, a solid phase competitive ELISA (SPCE) in four dilution format was developed and approved by DAHD for the seromonitoring activity under FMDCP. The SPCE is suitable for mass serology and is routinely used in World Reference Laboratory (WRL) on FMD, Pirbright, UK. Further, the specificity of the SPCE was reported by many research publications to be considerably higher than that of the LPBE and almost equivalent to that of the virus neutralisation test. It is easier to use, more robust and specific and therefore offers an improvement for FMD virus specific antibody detection.

Sampling Strategy followed for Post Vaccination Monitoring

In India, the districts are subdivided into talukas/blocks and further into villages. The villages are considered to be one epidemiological unit (Epi-unit). For sero-conversion study, two-stage random sampling strategy has been followed till 2019. In the first stage, 10 villages (each village is a single epi-unit) in each district were selected using randomization calculator,

in such a way that each taluka was represented for sampling. In the second stage, 20 bovines were selected (above >24 months of age) from each village for sampling (before and after the vaccination) following a simple random sampling technique. The whole process of sample collection (pre-vaccination and post-vaccination sampling) was repeated again during each round of vaccination through randomized calculator. However, it is important to note that during each round of vaccination, the villages in a district have been changed to collect the pre- and post-vaccination serum samples. Therefore, this strategy has been providing a clear immunity figure of the whole state or country. .

The above post-vaccination sampling strategy has been designed to determine the efficacy of both vaccine and vaccination programme. However, the experts of the OIE FMD Mission to India feel to change the sampling strategy as per OIE guidelines in order to provide a clear picture of the population immunity. Considering the recommendation, ICAR-NIVEDI in collaboration with ICAR-DFMD developed a new post vaccination seromonitoring sampling strategy

Recommended Two -stage sampling plan for Post Vaccination Monitoring

All form of epidemiological investigations requires the scientific sampling plan for collection of data on health problems includes serum samples in surveillance or monitoring in a specific population. Estimation of frequency of disease is a prerequisite to establish the disease control program, hence sampling the populations in order to estimate the disease frequency is common task for epidemiologists. In sampling, we ensure that animals are typical of the target population that the estimate of disease frequency is unbiased and precise (low standard error). Simple random sampling, systematic or stratified random samplings are the most commonly used sampling methods in which the animal is sampling unit, provides the precise estimates of disease frequency.

The use of two-stage sampling has evolved to meet surveillance or monitoring objectives for two reasons. First, list of frames of animals for randomized sample selection do not typically exist at a regional or national level, but the list frames of herds or villages can be developed and maintained more readily.

The objectives of seromonitoring of FMD in India

1. To provide the Sampling Scheme for estimation of total number of animals to be sampled, total number of villages (epi units) to be selected, number of animals within the village to be sampled and location of villages for pre seromonitoring of FMD in India.
2. To use the same sampling scheme for post vaccination monitoring to estimate the unbiased and robust estimate of protection levels of FMD in India.

In this scheme we employed stratified random sampling with district as stratification variable for buffalo and cattle population in different states. The input requirements of sampling plan were (1). animal level prevalence of unprotection ($1-P(\text{protection})$) is 20% is used as median value of unprotection levels across the different age group of animals, (2) cluster or village level prevalence of 20%, 10% and 5% for large , medium and small states were used and (3) sensitivity of 90% and specificity of 100% of diagnostic tests. Two -stage stratified random sampling plan was generated at 95% confidence using in-house developed epi-calculator https://nivedi.res.in/Nadres_v2/EpiCal/stratified/random_sampling.php. Sampling plan will provide the guidelines for selecting villages and its location like block, district and state level information along with livestock population, number of animals to be sampled within village, and proportion of buffaloes and cattle to be sampled in each selected village. The summary of sampling plan generated using two-stage stratified random sampling scheme is presented in Table 1.

Table 1: Summary of sampling plan using two-stage stratified random sampling technique for seromonitoring of FMD in India

**** 20th Livestock Census (DAHD, GoI)**

Note: The proportion of samples collected from each village need to be distributed among three age categories viz; 6-12 months, 13-24 months and >24 months at a ratio of 5:4:1

Collection and transport of serum samples

- Serum should be collected using a sterile needle and syringe
- At least 2ml of serum should be submitted to the testing laboratory and for that 4-8 ml whole blood needs to be collected without anticoagulant.
- The blood is usually collected from the jugular vein
- After collection, the sample should be allowed to stand in a cool area, out of direct sunlight for at least 15 minutes to allow clot formation
- Serum should be separated before submission to the laboratory.
- The sample should be centrifuged or, if this is not available, stand the sample in an upright position overnight in a cool box or refrigerator
- Place serum into a plain, sterile tube and send to the laboratory under cool condition
- If dispatch to a laboratory is delayed, serum samples should be frozen and stored at -20 °C
- Samples should be accompanied by proper epidemiological data sheet

Salient points to be considered as recommended by OIE

- Animals are sampled at two different points in time to assess the changes in population immunity. Sampling at time 0 (time of vaccination) and again after 21-28 days post vaccination to assess increase in the level of population immunity. It should be noted that, if such double sampling is carried out, it is not essential that the same animals are sampled in the two rounds. However, in a particular round, pre and post vac samples should be collected from same animals
- In general, estimating the immune status at individual animal level is recommended whenever vaccination is carried out in countries qualified at PCP stage 2 or 3, while the estimation of immune status at epi-unit level may be recommended at higher stages of PCP when expectation of virus circulation is low and a country is official status of freedom with or without vaccination.
- In the new sampling frame, population immunity at individual animals are followed
- When a vaccination programme is regularly implemented, there is a direct association between immunity level and age. Therefore, stratification by age is recommended. Stratification by age will facilitate the interpretation of the test results. Each of those different age groups should be considered a different subpopulation
- If estimation of the level of immunity is restricted to only one specific age category, it is suggested that the age category one to two years old be sampled, which will probably

include animals already vaccinated many times and may provide some insight into the immunity levels in younger age classes (likely to be lower) and older age classes (likely to be higher).

- In theory, animals less than 6 months old could also be sampled, but, in practice, usually only two or three age categories are evaluated, namely 6–12 months old, 12–24 months old and more than 24 months old. Should the survey be restricted only to those age groups eligible for vaccination, the six months and under category will be excluded and sample sizes remain unchanged for the three age groups considered.
- Suggested values for the expected proportion of animals with a specific level of antibodies in the following
 - a) age groups:
 - age 6–12 months – expected proportion 70%;
 - age 13–24 months – expected proportion 80%;
 - age > 24 months – expected proportion 90%.
 - b) Allowable standard error – 10%.
 - c) Level of confidence – 95%.

Stratified Random Sampling - Andaman And Nicobar Islands (Code - 1)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 1 + (Cattle + Buffalo) = 312

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 110

Total No of Animals to be Sampled = 1430

Stratified Random Sampling - Andhra Pradesh (Code - 2)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 5044

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 2145

Stratified Random Sampling - Chandigarh (Code - 6)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 1 + (Cattle + Buffalo) = 21

Design Level Prevalence = 0.3

Cluster Level Prevalence = 0.21

Sensitivity of the test used = 0.85

Total No of Villages (Clusters) Selected = 14

Total No of Animals to be Sampled = 196

Stratified Random Sampling - Chhattisgarh (Code - 7)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 300 + (Cattle + Buffalo) = 7801

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 2145

Stratified Random Sampling - Himachal Pradesh (Code - 13)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 200 + (Cattle + Buffalo) = 3437

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 110

Total No of Animals to be Sampled = 1430

Stratified Random Sampling - Jammu And Kashmir (Code - 14)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 200 + (Cattle + Buffalo) = 3630

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 110

Total No of Animals to be Sampled = 1430

Stratified Random Sampling - Maharashtra (Code - 20)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 7459

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 332

Total No of Animals to be Sampled = 4316

Stratified Random Sampling - Rajasthan (Code - 28)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 12142

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 332

Total No of Animals to be Sampled = 4316

Stratified Random Sampling - Sikkim (Code - 29)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 200 + (Cattle + Buffalo) = 265

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 110

Total No of Animals to be Sampled = 1430

Stratified Random Sampling - Uttar Pradesh (Code - 33)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 22851

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.0055

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 604

Total No of Animals to be Sampled = 7852

Stratified Random Sampling - West Bengal (Code - 35)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 200 + (Cattle + Buffalo) = 15489

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 2145
