ACKNOWLEDGEMENTS

Authors would like to express their sincere gratitude to Secretary DARE and Director General, ICAR, Ministry of Agriculture & Farmer`s Welfare, for his constant guidance and support in bringing out this bulletin on sampling plan for NADCP.

It is to place on record our acknowledgement to Deputy Director General (Animal Science) for his valuables suggestions and moral support in bringing out this bulletin on sampling plan.

Our special thanks are due to Department of Animal Husbandry and Dairying, Ministry of Animal Husbandry, Dairying and Fisheries, Government of India, New Delhi for their encouragement in planning to bring this bulletin.

Authors also aknowledge the Director (A), ICAR-NIVEDI for his support and encouragement in bringing out this manual on Sampling plan for Sero-Surveillance for FMD - 2021

Authors thank all the Scientists of ICAR-NIVEDI and ICAR-DFMD for their inputs in bringing this bulletin.

We also thank our research fellows working in Spatial Epidemiology lab of ICAR-NIVEDI for their hard work in programming and technical assistance in generating sampling plan

FMD Sero-surveillance

Introduction and objectives

India is in the stage 2 of progressive control pathway of FMD. In order to contain the disease, mass vaccination program have been taken up on a country wide scale. If India is progress to the next stage of the PCP, it should have proper post vaccination monitoring and surveillance in place. The mass vaccination of cattle and buffaloes is taking place two times a year and so are the vaccination and post vaccination monitoring activity. FMD surveillance in India is currently focusing on knowing the virus circulation (finding the cases) and knowing level of the disease in the population. Therefore, surveillance aimed at demonstrating the absence of disease or infection, does not apply to the current scenario.

In India, vaccination with inactivated vaccine is the primary mode of FMD control. There is a challenge to identify the infected animals among the vaccinated animals based on serology for appropriate implementation of the control programme. Differentiation of these two categories of animals is important during serological surveys to detect evidence of infection. During active viral replication following FMD virus infection, arrays of non-structural proteins (NSPs) are produced that elicit anti-NSP antibodies, which is not the case in animals, which are vaccinated against FMD with inactivated virus vaccine. This phenomenon has been exploited to measure antibodies to 3AB3, a non-structural protein in the currently ongoing surveillance activity. For the said purpose, 3AB3, a non-structural protein has been expressed using recombinant DNA technology and the so expressed recombinant protein has been used in an ELISA test to differentiate vaccinated from FMD virus infected (DIVA) animals. This indigenously developed rDIVA-FMD kit, has been validated for mass scale comprehensive sero-surveillance as per the OIE approved guidelines and is at least four-times economical than the commercial DIVA kits available on import. The diagnostic sensitivity and specificity of this kit is estimated to be 95% and 98%, respectively. Now this kit is in extensive use in the country as a companion diagnostic in the National FMD control programme. Use of DIVA assay is essential in identification of potential disease free zones (DFZs) with vaccination in India.

With the above background, surveillance activity at the national level is planned. The sole objective of the sero-surveillance has been to measure the level the disease presence by screening the cattle and buffalo sera against non-structural proteins (NSPs) particularly 3B3 and to identify high risk regions for planning and implementing appropriate control measures.

Sampling Strategy currently used for Sero-surveillance

All form of epidemiological investigations requires the scientific sampling plan for collection of data on health problems. Estimation of prevalence of a disease is a prerequisite to establish the disease control program, hence sampling the populations in order to estimate the level of disease prevalence is common task for epidemiologists. In sampling, one should ensure that animals are representative of the target population so that the estimated value/s are unbiased and precise (low standard error). Simple random sampling, systematic or stratified random samplings are the most commonly used sampling methods.

In the developed world, which practice two stage sampling, the individual livestock farm forms the primary sampling unit. However, this concept cannot be adopted in our country as farm wise details are not available to prepare a sampling frame. Additionally, in a country where small farms (2-3 animals/household) are a norm, the farm becomes too small a unit to do the sampling. In such a situation, taking the village as primary sampling unit makes sense as fairly homogeneous population of animal exist in a village and these form a natural cluster. It is argued that in a large population where animals are separated into herds (villages in our context), disease has a strong tendency to cluster. This is because the disease agent or agents (whether infectious, environmental or genetic) are generally not evenly distributed throughout the population. With rare diseases, this clustering is usually even more pronounced. As a result, a very low proportion of herds may be affected by a particular disease-but within those affected herds, the prevalence of the disease amongst animals may be quite high. If a survey designed to detect the presence of disease fails to take into account the clustering of disease in the population, the results of the survey are likely to be very unreliable. This is because the probability formulae that the surveys are based on assumption that every unit in the population has the same probability of being affected. Another problem with large-area surveys is the logistics of sampling. The solution to both these problems is to use a two-stage sampling strategy in which villages form the primary sampling units (first stage), and individual animals within selected villages make secondary sampling units (second stage). In this way, the sample sizes at each stage can be adjusted to reflect the different disease prevalence's (the proportion of villages affected in the first stage, and the proportion of animals affected in the village at the second stage). Two-stage sampling also means that the construction of sampling frames is much simpler. At the first stage, only a list of all villages (defined epi unit) in the population is required, and at the second stage, only animals in each of the selected villages are to be included in the list.

In this sampling scheme we employed two stage stratified random sampling, with district as stratification variable for buffalo and cattle population in different states. The present sampling

strategy is a deviation from the previous sampling methodology. It is to be recalled that earlier a total of 200 bovine serum samples (animals 6 months- 18 months of age) per annum/district were arbitrarily collected from various districts of India for 3AB3-NSP based sero-surveillance activity.

The input requirements used for sampling plan were;

- a. The estimated animal level prevalence for 3B3 protein as shown in Table 1,
- b. Theoretical village level prevalence of 20%, 15%, 10% and 5% for small (states having target population up to 1.5% of total), medium (states having target population up to 5% of total), large (states having target population up to 10 % of total), very large (states having target population more than 10% of total) states respectively to provide better representation of villages within the district and state.
- c. diagnostic sensitivity of 90% and specificity of 100% for 3B3 NSP ELISA

Two -stage stratified random sampling plan was generated at reasonably high confidence (0.95%) using in-house developed using epi-calculator under NADRES v2 by ICAR-NIVEDI, Bengaluru.(https://nivedi.res.in/Nadres_v2/Epical/stratified/random_sampling.php). The summary of sampling plan generated using two-stage stratified random sampling scheme is presented in Table 2.

Table 1: Statewise NSP antibody positivity in percent used for calculating sample size

**** 20th Livestock Census (DAHD, GoI)** Animals of 6 months to 18 months of age to be sampled, samples to be collected preferably 4 to 5 months after previous vaccination or 1 to 2 months before vaccination.

Guidelines for collection of random samples

Given below is the example provided by us to the coordinating unit for sample collection.

Example: If you are asked to collect 5 samples from a village having 17 animals (cattle & buffaloes together), you are supposed to do systematic random sampling as follows;

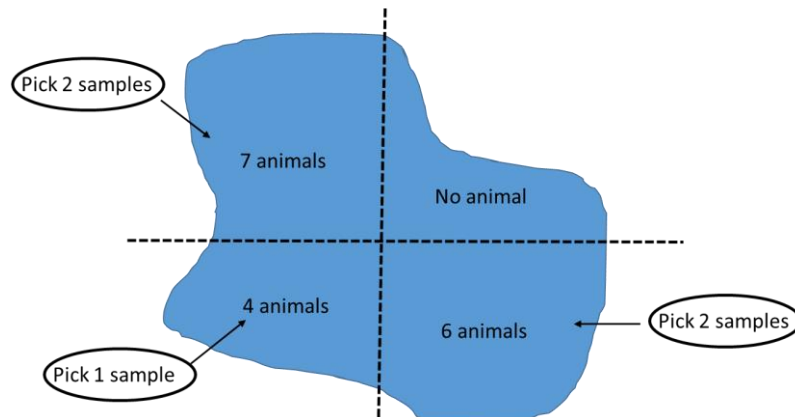

In a table, enumerate and list all the households/owners having the given species of animals. Say for example there are three owners viz., Avinash Alur, Avinash B, Avinash Sunkad in the village with 7 (5 buffaloes & cattle), 6 (3 buffaloes & 3 cattle), 4 (cattle) number of animals respectively, then make the sampling frame as follows;

S. No.	Owner (Hosuehold)	Total (Cattle+Buffaloes)	Temporary ID	
1	Avinash Alur	7	AA1	
2			AA2	4 th sample
3			AA3	
4			AA4	
5			AA5	5 th sample
6			AA6	
7			AA7	
8	Avinash B.	6	AB1	
9			AB2	
10			AB3	1 st sample
11			AB4	
12			AB5	
13			AB6	2 nd sample
14	Avinash Sunkad	4	AS1	
15			AS2	
16			AS3	3 rd sample
17			AS4	

Pick a random number between 1-17 (as the village has total 17 animals)

Say, you picked 10 (S. No. 10), then identify the household/owner the pointing to the said serial number. In this case, it is house of Avinash B. Since you have to collect 5 samples from the list of 17 animals ($17/5=3.4$, round that to 3), mark every third animal in the list as shown above. Once you have identified the owners and the animals, go to the identified owners house, stand at the entrance/entry point of pen (shed), number the animals serially in a clockwise manner (remember line also makes part of the circle) starting from the one nearest to the entrance/entry point. In this case, it is third nearest animal from the entrance of the pen of Mr. Avinash B. Similarly, collect all the required samples as shown in the table. You should visit all the identified houses to collect samples.

Alternatively, you can hypothetically divide the village in to four quarters and pick the requisite number of samples from households as shown below

Standard Operating Procedure (SOP) for Collection and Dispatch of Serum

General requirements: Aseptic precautions should be observed right from collection of blood to dispatch of serum. It is advisable to wear gloves at all times (be it removal of stopper from vacutainer, centrifugation, pipetting, disposal of contaminated tubes, and clean-up of any spills) when handling the specimens. Used vacutainers, needles, and pipets must be properly disposed in accordance with biosafety/institutional requirements.

Serum Collection

Sample collection

- *Animals of 6 months to 18 months of age to be sampled,*
- *Samples to be collected preferably 4 to 5 months after previous vaccination or 1 to 2 months before vaccination.*

Materials required

- Vacutainers 5 ml capacity (Red Top, BD catalog No. 366430)
- Desktop Centrifuge (refrigerated preferably) with swinging bucket rotor
- Sterile 15ml polypropylene centrifuge tubes
- Sterile Cryovials (preferably internal threaded)
- 2ml, 5ml pipettes or 1ml micro pipettes and 1 ml sterile pipette tips.
- Ice Buckets
- Laminar Flow cabinet

Serum Separation Procedure

- ❖ Keep the vacutainer in a slanting position after the blood is drawn (draw blood only up to 2/3 of the maximum volume) at room temperature for a minimum of 30 to a maximum of 60 minutes to allow the clot to form.
- ❖ If the blood is not centrifuged immediately after the clotting time, the tubes should be placed on ice or refrigerated. (4°C).
- ❖ Transfer the content of the vacutainer to a sterile 15 ml centrifuge tube (if you are doing this in the lab kindly use laminar flow).
- ❖ Centrifuge the blood sample at in a swing-out rotor for 20 minutes at 1100-1300 g at room temperature.

Warning: Excessive centrifuge speed (over 2000 g) may cause tube breakage
--

- ❖ At the end of the centrifugation transfer the serum (Recommendation: do not pour!) to a sterile labelled cryo vial (preferably internal threaded) using a pipette. Close the caps on the vials tightly.

Note: It would be wise to keep the pipet above the red blood cell layer and leave a small amount of serum in the tube so as avoid picking up red blood cells.
--

- ❖ Check that all aliquot vial caps are secure and that all vials are labelled.

- ❖ Place all aliquots upright in a specimen box or rack in an -20°C or colder freezer. All specimens should remain at -20°C or below prior to shipping.

Serum Shipping Instructions

- ❖ Use at least 1 inch thick walled thermocol box for shipping of serum
- ❖ The serum samples should be preferably shipped in dry ice, if not add sufficient number of ice packs which were earlier stored in -80°C. If ice packs are used for shipping, ensure that samples are placed within layer of icepacks.
- ❖ Kindly ensure that there is no leakage during shipment. To do this it wise to keep the vials in a cryo box and ship.
- ❖ Ship the serum as quickly as possible preferably by overnight courier.
- ❖ Inform DFMD/relevant laboratory telephonically about the shipping.
- ❖ Ensure that the samples are accompanied by standard proforma attached herewith in appendix II (proforma for serum dispatch to ICAR-DFMD/Relevant Lab)

Please contact for any clarifications on SOP and Sampling plan issues:

Stratified Random Sampling - Andhra Pradesh (Code - 2)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 5007

Design Level Prevalence = 0.05

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 179

Total No of Animals to be Sampled = 9308

Stratified Random Sampling - Bihar (Code - 5)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 7269

Design Level Prevalence = 0.19

Cluster Level Prevalence = 0.019

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 174

Total No of Animals to be Sampled = 2436

Stratified Random Sampling - Goa (Code - 10)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 50 + (Cattle + Buffalo) = 233

Design Level Prevalence = 0.19

Cluster Level Prevalence = 0.038

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 87

Total No of Animals to be Sampled = 1218

Stratified Random Sampling - Haryana (Code - 12)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 3909

Design Level Prevalence = 0.05

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 179

Total No of Animals to be Sampled = 9308

Stratified Random Sampling - Himachal Pradesh (Code - 13)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 200 + (Cattle + Buffalo) = 3450

Design Level Prevalence = 0.13

Cluster Level Prevalence = 0.013

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 255

Total No of Animals to be Sampled = 5100

Stratified Random Sampling - Jammu And Kashmir (Code - 14)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 100 + (Cattle + Buffalo) = 5068

Design Level Prevalence = 0.161

Cluster Level Prevalence = 0.0161

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 206

Total No of Animals to be Sampled = 3296

Stratified Random Sampling - Jharkhand (Code - 15)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 4417

Design Level Prevalence = 0.562

Cluster Level Prevalence = 0.0281

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 117

Total No of Animals to be Sampled = 585

Stratified Random Sampling - Ladakh (Code - 39)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 50 + (Cattle + Buffalo) = 215

Design Level Prevalence = 0.19

Cluster Level Prevalence = 0.038

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 87

Total No of Animals to be Sampled = 1218

Stratified Random Sampling - Lakshadweep (Code - 18)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 1 + (Cattle + Buffalo) = 10

Design Level Prevalence = 0.50

Cluster Level Prevalence = 0.4

Sensitivity of the test used = 0.6

Total No of Villages (Clusters) Selected = 7

Total No of Animals to be Sampled = 98

Stratified Random Sampling - Maharashtra (Code - 20)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 7499

Design Level Prevalence = 0.213

Cluster Level Prevalence = 0.0213

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 155

Total No of Animals to be Sampled = 2015

Stratified Random Sampling - Mizoram (Code - 23)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 20 + (Cattle + Buffalo) = 350

Design Level Prevalence = 0.211

Cluster Level Prevalence = 0.0422

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 78

Total No of Animals to be Sampled = 1014

Stratified Random Sampling - Odisha (Code - 25)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 2528

Design Level Prevalence = 0.091

Cluster Level Prevalence = 0.0182

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 182

Total No of Animals to be Sampled = 5278

Stratified Random Sampling - Punjab (Code - 27)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 3987

Design Level Prevalence = 0.104

Cluster Level Prevalence = 0.0104

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 319

Total No of Animals to be Sampled = 7975

Stratified Random Sampling - Rajasthan (Code - 28)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 12232

Design Level Prevalence = 0.286

Cluster Level Prevalence = 0.0286

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 115

Total No of Animals to be Sampled = 1035

Stratified Random Sampling - Sikkim (Code - 29)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 50 + (Cattle + Buffalo) = 303

Design Level Prevalence = 0.19

Cluster Level Prevalence = 0.038

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 87

Total No of Animals to be Sampled = 1218

Stratified Random Sampling - Telangana (Code - 31)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 3818

Design Level Prevalence = 0.05

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 179

Total No of Animals to be Sampled = 9308

Stratified Random Sampling - Uttarakhand (Code - 34)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 200 + (Cattle + Buffalo) = 2823

Design Level Prevalence = 0.135

Cluster Level Prevalence = 0.0135

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 246

Total No of Animals to be Sampled = 4674

Stratified Random Sampling - West Bengal (Code - 35)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 7408

Design Level Prevalence = 0.361

Cluster Level Prevalence = 0.0361

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 91

Total No of Animals to be Sampled = 728
